

TYPES OF VISION SCREENING UTILIZED

The Snellen Test is used to determine problems in distance vision.

For students with problems in reading or other areas other than distance, we utilize the following tests for the conditions indicated.

Near point optical card	Near vision
Cover/uncover	Strabismus/muscle balance/accommodation
Hirschberg/pupil light	Strabismus/muscle balance/accommodation
Extra ocular movements	Ocular motor nerve dysfunction

The child should be seen as a whole by the school nurse to determine the problems that are interfering with achievement in school.
